

## ABSTRACT

The present invention is directed to a container with a removable handle. The container has spaced first and second knobs. The handle is configured as a split tubular member having a central portion and spaced internal first and second contoured portions proximate opposite ends thereof. Each of the contoured portions is configured to receive one of the knobs. The first and second contoured portions tensionably engage the first and second knobs when the central portion is grasped by a user. A method of securing the handle to the container is also disclosed.
